E-mail id: srinivasthiruchinapalli@gmail.com

Abstract: Key generation and Secure are critical to the security of a Cryptosystem. Key generation and key exchange is the most challenging part of cryptography. In this paper, a scheme for symmetric key generation based on Pythagorean and Reciprocal Pythagorean triple has been presented. The proposed scheme incorporates a Key Distribution Centre (KDC) for user authentication and the secure exchange of secret information to generate keys. The KDC operation involves a request from a user for initiation. The KDC authenticates the initiator. If the authentication is successful, KDC generates and sends an encrypted timestamp to both the initiator and responder. The proposed system is based on a novel mechanism to determine Pythagorean and Reciprocal Pythagorean triples to generate keys.

Introduction:
From the References [1],[2],[3],[4],[5],[6],[7],[8],[9],[10], Equations to be solved with integer values of the unknowns are now called Diophantine equations and the study of such equations is known as Diophantine Analysis. The equation \(x^2 + y^2 = z^2\) for Pythagorean triples is an example of a Diophantine equation.
Euclid's formula is a fundamental formula for generating Pythagorean triples given a self-assertive match of whole numbers \(m\) and \(n\); with \(m > n > 0\). The formula states that the integers

\[a = m^2 - n^2, \quad b = 2mn, \quad c = m^2 + n^2\]

form triple, Pythagorean.

By Euclid's formula triple is primitive if and only if \(m\) and \(n\) are coprime and not both odd. When both \(m\) and \(n\) are odd, then \(a, b,\) and \(c\) will be even, and the triple will not be primitive.

The following will generate all Pythagorean triples remarkably:

\[a = k \cdot (m^2 - n^2), \quad b = k \cdot (2mn), \quad c = k \cdot (m^2 + n^2)\]

where \(m, n,\) and \(k\) are +ve integers with \(m > n,\) and with \(m\) and \(n\) odd, not both at the same time and coprime. Since the time of Euclid, several formulas for generating triples with specific conditions have been established.

https://doi.org/10.32388/MTTDWD
Various Methods to Generating Pythagorean Triple:
From References [10],[11],[12],[13],[14],[15],[16],[17],[18],[19],[20],[21],[22],[23],[24],[25],[26],[27]

following results will be occurred

Case 1: to Generate a Pythagorean Triple \((x_1, x_2, x_3)\) for each \(x_1\), there exists at least one \(x_2\) and at least one \(x_3\), with
\[
\begin{align*}
x_2 &= \left| ax_1^2 - \frac{1}{4a} \right|,
x_3 &= \left| ax_1^2 + \frac{1}{4a} \right|, \\
\end{align*}
\]
where \(a = \begin{cases} 
\frac{1}{2p}, & \text{if } x_1 \text{ is an odd factor of } x_1^2, \\
\frac{1}{4p}, & \text{if } x_1 \text{ is an even factor of } \left(\frac{x_1}{2}\right)^2.
\end{cases}\)

Case 1.1: If \(x_1\) is an odd

Consider \(x_2 = \left| ax_1^2 - \frac{1}{4a} \right|\) since \(p\) is a factor of \(x_1^2\).

Therefore \(x_1^2 = np\) where \(n\) is an integer
\[
x_2 = \left| \frac{np}{2p} - \frac{1}{4\left(\frac{1}{2p}\right)} \right| = \left| \frac{n-p}{2} \right|, \text{ both } n \text{ and } p \text{ odd numbers } \frac{n-p}{2} \text{ become an integer.}
\]

Similarly, \(x_3 = \left| ax_1^2 + \frac{1}{4a} \right|\) since \(p\) is a factor of \(x_1^2\). Therefore
\[
x_1^2 = np\text{ where } n \text{ is an integer.}
\]
\[
x_3 = \left| \frac{np}{2p} + \frac{1}{4\left(\frac{1}{2p}\right)} \right| = \left| \frac{n+p}{2} \right|, \text{ both } n \text{ and } p \text{ odd numbers } \frac{n+p}{2} \text{ become an integer.}
\]

Hence \((x_1, x_2, x_3)\) becomes a Pythagorean Triple.

Table 1: Some results are represented below:

| \(x_1\) | Choose \(p\) (Factor of \(x_1^2\)) | \(n = \frac{x_1^2}{p}\) | \(x_2 = \left| ax_1^2 - \frac{1}{4a} \right| = \frac{n-p}{2}\) | \(x_3 = \left| ax_1^2 + \frac{1}{4a} \right| = \frac{n+p}{2}\) | \((x_1, x_2, x_3)\) |
|---|---|---|---|---|---|
| 3 | 1 | 9 | 4 | 5 | (3,4,5) |
| 15 | 1 | 225 | 112 | 113 | (15,112,113) |
| 15 | 3 | 75 | 36 | 39 | (15,36,39) |
Computer programming (c #) to Generate Pythagorean Triples for x is an odd integer from 3 to 100 as follows

For x is an odd integer:

Program:
```
var output = new List<Tuple<int, int, int, int, int>>();
var facts = new Dictionary<int, List<int>>();
for (int i = 3; i <=100; i++)
{
    // for x is odd integer
    if (i % 2 != 0)
    {
        facts.Add(i, Factor(i*i));
    }
}
for each (var item in facts)
{
    var x1= item.Key;
    for each (var item2 in item.Value)
    {
        var p = item2;
        var n = (x1 * x1) / p;
        var x2 = Math.Abs((n - p) / 2);
        var x3 = (n + p) / 2;
        output.Add(Tuple.Create(x1, p, n, x2, x3));
    }
}
Console.WriteLine($"| x1 | p | n | x2 | x3 | (x1,x2,x3) |");
Console.WriteLine();
for each (var item in output)
{
    Console.WriteLine($"|{item.Item1,5}|{item.Item2,5}|{item.Item3,5}|{item.Item4,5}|{item.Item5,5}|({item.Item1,item.Item4,item.Item5})|");
}
List<int> Factor(int number)
{
    var factors = new List<int>();
    int max = (int)Math.Sqrt(number); // Round down
    for (int factor = 1; factor <= max; ++factor) // Test from 1 to the square root, or the int below it, inclusive.
    {
        if (number % factor == 0)
        {
```
factors.Add(factor);
        if (factor != number / factor) // Don't add the square root twice!
            factors.Add(number / factor);
    }
    return factors;
}

Case 1.2: If $x_1$ is an even.

Consider $x_2 = \left| ax_1^2 - \frac{1}{4a} \right|$ since $p$ is a factor of $\left( \frac{x_1}{2} \right)^2$. There fore

$$x_2^2 = 4np$$

where $n$ is an integer

$$x_2 = \left| \frac{4np}{4} - \frac{1}{4p} \right| = |n - p|$$

both $n$ and $p$ are integers, hence $x_2$ is also an integer.

Similarly, $x_3 = \left| ax_1^2 + \frac{1}{4a} \right|$ since $p$ is a factor of $\left( \frac{x_1}{2} \right)^2$. Therefore

$$x_3^2 = 4np$$

where $n$ is an integer

$$x_3 = \left| \frac{np}{4p} + \frac{1}{4(\frac{1}{4p})} \right| = |n + p|$$

both $n$ and $p$ are integers, hence $x_3$ is also an integer.

Hence $(x_1, x_2, x_3)$ becomes a Pythagorean Triple.

Table 2: Some results are represented below:

| $x_1$ (Factor of $(\frac{x_1}{2})^2$) | Choose $p$ | $n = \frac{x_2^2}{4p}$ | $x_2 = \left| ax_1^2 - \frac{1}{4a} \right| = n-p$ | $x_3 = \left| ax_1^2 + \frac{1}{4a} \right| = n+p$ | $(x_1, x_2, x_3)$ |
|---|---|---|---|---|---|
| 4 | 1 | 4 | 3 | 5 | (4,3,5) |
| 6 | 3 | 3 | 0 | 6 | (6,0,6) |
| 6 | 1 | 9 | 8 | 10 | (6,8,10) |
| 8 | 1 | 16 | 15 | 17 | (8,15,17) |
| 8 | 2 | 8 | 6 | 10 | (8,6,10) |

Computer programming (c #) to Generate Pythagorean Triples for $x$ is an even integer from 2 to 100 as follows

Program:

```c#
var output = new List<Tuple<int, int, int, int>>();
var facts = new Dictionary<int, List<int>>();
for (int i = 3; i <=100; i++)
```
for x is Even integer
if (i % 2 == 0)
{
    facts.Add(i, Factor(((i/2) * (i/2)) ));
}
}
for each (var item in facts)
{
    var x1= item.Key;
    for each (var item2 in item. Value)
    {
        var p = item2;
        var n = (x1 * x1) / (4 *p);
        var x2 = Math.Abs(n - p);
        var x3 = (n + p);
        output.Add(Tuple.Create(x1, p, n, x2, x3));
    }
}
Console.WriteLine($"| x1 | p | n | x2 | x3 | (x1,x2,x3) ");
List<int> Factor(int number)
{
    var factors = new List<int>();
    int max = (int)Math.Sqrt(number); // Round down
    for (int factor = 1; factor <= max; ++factor) // Test from 1 to the square root, or the int below it, inclusive.
    {
        if (number % factor == 0)
        {
            factors.Add(factor);
            if (factor != number / factor) // Don't add the square root twice!
                factors.Add(number / factor);
        }
    }
    return factors;
}

Case 1.3: Another Method to Generate Pythagorean Primitive Triple
**Theorem:** Choose $a$ and $b$ and $c^2 = 2ab$. Then $(a + c, b + c, a + b + c)$ is a Pythagorean Triple.

**Proof:** Consider $(a + b + c)^2 - (a + c)^2 = (a + c)^2 + b^2 + 2(a + c)b - (a + c)^2$

$$= b^2 + 2(a + c)b = b^2 + 2ab + 2bc$$

But $c^2 = 2ab$ implies $2a = \frac{c^2}{b}$. imply $(a + b + c)^2 - (a + c)^2 = (b + c)^2$.

Hence $(a + c, b + c, a + b + c)$ becomes a Pythagorean Triple when $c^2 = 2ab$.

Let $a$, and $b$ are relatively prime then $(a + c, b + c, a + b + c)$ is a Primitive, otherwise, it becomes Non-primitive Pythagorean Triple.

**Table 3:** Some results are represented below table:

<table>
<thead>
<tr>
<th>$A$</th>
<th>$b$</th>
<th>$c = \sqrt{2ab}$</th>
<th>$x_1 = a + c$</th>
<th>$x_2 = b + c$</th>
<th>$x_3 = a + b + c$</th>
<th>$(x_1, x_2, x_3)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>9</td>
<td>6</td>
<td>8</td>
<td>15</td>
<td>17</td>
<td>(8,15,17)</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>10</td>
<td>(6,8,10)</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
<td>6</td>
<td>9</td>
<td>12</td>
<td>15</td>
<td>(9,12,15)</td>
</tr>
</tbody>
</table>

Now we can go to introduce another Method to Generate Pythagorean Triple using Fibonacci and Pell numbers.

**Case 1.4:** Introduce Generate Pythagorean Triples using a sequence of **Fibonacci numbers** as follows. Let $\emptyset : \mathbb{Z}^2 \rightarrow \mathbb{Z}^3(P)$ with

$$\emptyset(F_n, F_{n+1}) = ((2F_{n+1}(F_n + F_{n+1}), F_n(2F_{n+1} + F_n), F_{n+1}^2 + (F_n + F_{n+1})^2)).$$

From Chapter 1, the sequence of Fibonacci numbers is $\{1, 1, 2, 3, 5, 8, 13, 21, \ldots \}$ following Recurrence Relation $F_n = F_{n-1} + F_{n-2}$ for $n \geq 2$, with $F_0 = 1, F_1 = 1$.

Now we can go to study the generation of Pythagorean Triples using Fibonacci numbers as follows.

**Table 4:** Some results are represented below:

| $F_n$ | $F_{n+1}$ | $(2(F_{n+1}(F_n + F_{n+1}), F_n(2F_{n+1} + F_n), F_{n+1}^2 + (F_n + F_{n+1})^2)$ | $\{4, 3, 5\}$ |
Case 1.5: Introduce generating Pythagorean Triples using a sequence of Pell numbers as follows.

Let $\varphi: \mathbb{Z}^2 \rightarrow \mathbb{Z}^3(P)$ with $\varphi(P_n, P_{n+1}) = (2P_nP_{n+1}, P_{n+1}^2 - P_n^2, P_{n+1}^2 + P_n^2)$.

From Chapter 1, Pell Numbers $\{0, 1, 2, 5, 12, 29 \ldots \}$ are Satisfies following Recurrence Relation $P_n = 2P_{n-1} + P_{n-2}$ for $n \geq 2$, with $P_0 = 0, P_1 = 1$. Now we can go to study the generation of Pythagorean Triples using pell numbers as follows.

Table 5: Some results are represented below:

<table>
<thead>
<tr>
<th>$P_n$</th>
<th>$P_{n+1}$</th>
<th>$(2P_nP_{n+1}, P_{n+1}^2 - P_n^2, P_{n+1}^2 + P_n^2)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>(0,1,1)</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>(4,3,5)</td>
</tr>
<tr>
<td>2</td>
<td>5</td>
<td>(20,21,29)</td>
</tr>
<tr>
<td>5</td>
<td>12</td>
<td>(120,119,169)</td>
</tr>
<tr>
<td>12</td>
<td>29</td>
<td>(696,697,985)</td>
</tr>
</tbody>
</table>

Note: in a cryptographic system, symmetric key generation is depending on two consecutive Values of Fibonacci and Pell numbers.

Case 2: Generating Reciprocal Pythagorean Triples
The solutions of the Diophantine Equation $x^n + y^n = z^n$ are satisfied the Reciprocal Pythagorean Theorem RPT = $\{(x, y, z) \in \mathbb{Z}^3 : \frac{1}{x^2} + \frac{1}{y^2} = \frac{1}{z^2}\}$ for $n = -2$. 
The Reciprocal Pythagorean Theorem relates the two legs a, b to the altitude h is defined as follows: 

\[ \frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{h^2} \]

with \( c = \frac{ab}{h} \).

Now introduce a Method, to Generate a Set of Reciprocal Pythagorean Triples using Euclid's methodology of Generation of Pythagorean Triples.

![Diagram of Reciprocal Pythagorean Theorem]

Consider the Reciprocal Pythagorean Theorem: 

\[ \frac{1}{x^2} + \frac{1}{y^2} = \frac{1}{z^2} \]

It follows that \( \frac{1}{x^2} = \frac{1}{z^2} - \frac{1}{y^2} \).

Again Simplify, 

\[ 1 = \frac{x^2}{z^2} - \frac{x^2}{y^2} \]

It will follow that \( (\frac{x}{z} + \frac{x}{y})(\frac{x}{z} - \frac{x}{y}) = 1 \)

The above equations must satisfy the following conditions for some positive integers p, q.

\[ \frac{x}{z} + \frac{x}{y} = \frac{p}{q}, \quad \frac{x}{z} - \frac{x}{y} = \frac{q}{p} \]

From the above equations, 

\[ 2x = z\left(\frac{p}{q} + \frac{q}{p}\right), \quad 2x = y\left(\frac{p}{q} - \frac{q}{p}\right) \]

Choose, two positive integers p, q \( (p > q) \), let \( x = (p^2 + q^2)(p^2 - q^2) \).

It follows that \( z = 2pq(p^2 - q^2) \) and \( y = 2pq(p^2 + q^2) \)

Consider 

\[ \frac{1}{x^2} + \frac{1}{y^2} = \frac{1}{(p^2+q^2)(p^2-q^2)^2} + \frac{1}{(2pq(p^2+q^2))^2} = \frac{1}{(2pq(p^2-q^2))^2} = \frac{1}{z^2} \]

**Table 6:** Some results are represented below:

<table>
<thead>
<tr>
<th>p</th>
<th>q</th>
<th>x</th>
<th>y</th>
<th>z</th>
<th>Reciprocal Pythagorean Triples</th>

</table>
Computer programming to Generate a subset of the set of Reciprocal Pythagorean Triples

\[ x = (p^2 + q^2)(p^2 - q^2), \quad y = 2pq(p^2 + q^2), \quad z = 2pq(p^2 - q^2) \]

```c
#include <stdio.h>
#include <stdlib.h>
#include <math.h>

int main()
{
    int p, q;
    double x, y, z;

    for(p=2; p<=30; p++)
    {
        for(q=2; q<=30; q++)
        {
            if( p > q )
            {
                x = ((pow(p,2) + pow(q,2)) * (pow(p,2) - pow(q,2)));
                y = 2 * p * q * (pow(p,2) + pow(q,2));
                z = 2 * p * q * (pow(p,2) - pow(q,2));
                printf("For p= %d, q= %d; Values of (x,y,z) are (%.2f, %.2f, %.2f) \n", p, q, x, y, z);
            }
        }
    }
    return 0;
}
```

If \((x, y, z)\) is a Pythagorean triple then \((y z, x z, x y)\) is a Reciprocal Pythagorean triple, 
\((y z, x z, z^2)\) is a Pythagorean triple and vice versa. Extended this Lemma to generate at most 
all Pythagorean and Reciprocal Pythagorean \(n\)-tuples. 

**Corollary 2.1:** Each Pythagorean Triple \((x, y, z)\) is having corresponding Reciprocal 
Pythagorean Triple in the form of \((xz, yz, xy)\).
Proof: Each Pythagorean Triple \((x, y, z)\) is having corresponding Reciprocal Pythagorean Triple in the form of \((xz, yz, xy)\) since \(\frac{1}{(xz)^2} + \frac{1}{(yz)^2} = \frac{y^2 + x^2}{(xyz)^2} = \frac{z^2}{(xyz)^2} = \frac{1}{(xy)^2}\).

From Case 2.2, If \(\frac{a}{b} = x\), Now we can introduce to define some subsets of a Set of Reciprocal Pythagorean Triple as follows:

Table 7: \(A' = \{ (xz, yz, xy): \frac{xz}{yz} = 1 + \frac{2}{x^2 - 1} \text{ if } x \text{ is odd prime number or its power } \}\):

<table>
<thead>
<tr>
<th>(a)</th>
<th>(b)</th>
<th>(x = \frac{a}{b})</th>
<th>Corresponding Primitive Pythagorean Triples</th>
<th>Corresponding Reciprocal Pythagorean Triples</th>
</tr>
</thead>

Lemma 2.1: If $(x, y, z)$ is a Pythagorean triple then $(y z, x z, x y)$ is a Reciprocal Pythagorean triple and vice versa.

Proof: Let $(x, y, z)$ is a Pythagorean triple. i.e., $x^2 + y^2 = z^2$.

Consider $\frac{1}{(yz)^2} + \frac{1}{(xz)^2} = \frac{x^2+y^2}{x^2y^2z^2} = \frac{1}{(xy)^2}$. Hence $(y z, x z, x y)$ is Reciprocal Pythagorean Triple. Successively applying the same operation we obtain $(x^2yz, y^2xz, z^2xy)$ is a Pythagorean Triple. Since $(x^2yz)^2 + (y^2xz)^2 = (xyz)^2(x^2 + y^2) = (z^2xy)^2$.

Lemma 2.2: If $(x, y, z)$ is a Pythagorean triple then then $(y z, x z, z^2)$ is a Pythagorean triple.

Proof: Consider $(yz)^2 + (xz)^2 = z^2(x^2 + y^2) = z^4$. Hence $(y z, x z, z^2)$ is a Pythagorean triple.

It follows that If $(x, y, z)$ is a Pythagorean triple then $(y z, x z, x y)$ is a Reciprocal Pythagorean triple and $(y z, x z, z^2)$ is a Pythagorean triple. In this way, we can generate Pythagorean and Reciprocal Pythagorean triple with same two legs. Some results are represented in the below table

**Case 3: Construction of Pythagorean and Reciprocal Pythagorean triple for 4-tuple**

**Lemma 3.1:** If \((a, b, c, d)\) is a Pythagorean 4-tuple \((a^2 + b^2 + c^2 = d^2)\) then \((bcd, acd, abd, abc)\) becomes to corresponding Reciprocal Pythagorean 4-tuple.

**Proof:** Consider \(\frac{1}{(bcd)^2} + \frac{1}{(acd)^2} + \frac{1}{(abd)^2} = \frac{a^2+b^2+c^2}{a^2b^2c^2d^2} = \frac{1}{(abc)^2}\). Hence \((bcd, acd, abd, abc)\) is a Reciprocal Pythagorean 4-tuple. Continuing Lemma 2 to above 4-tuple, we obtain successively Pythagorean and Reciprocal Pythagorean 4-tuples respectively.

**Table 21:** Generating of Pythagorean and Reciprocal Pythagorean 4-tuples using Lemma 2

<table>
<thead>
<tr>

<td>(2.685465987 * 10^{22}, 2.01409949 * 10^{22})</td>
</tr>
</tbody>
</table>

Note: If \((a,b,c,d)\) is a Pythagorean 4-tuple \((a^2 + b^2 + c^2 = d^2)\) then \((bc, ac, ab, \frac{abc}{d})\) is identical form of Lemma 2. But it will not become a Reciprocal Pythagorean 4-tuple. We can verify this by taking one example.

Proof: Consider \(\frac{1}{(bc)^2} + \frac{1}{(ac)^2} + \frac{1}{(ab)^2} = \frac{a^2+b^2+c^2}{a^2b^2c^2} = \frac{d^2}{(abc)^2} = \frac{1}{(\frac{abc}{d})^2}\).

Hence \((bc, ac, ab, \frac{abc}{d})\) is a Reciprocal Pythagorean 4-tuple.

Continuing Lemma 2.2 to above 4-tuple, we obtain successively Pythagorean and Reciprocal Pythagorean 4-tuples respectively.

Now we can choose Pythagorean 4-tuple (3,4,12,13). Apply the above sufficient condition of \((bc, ac, ab, \frac{abc}{d})\), which implies (48,36,12,144/13) is not a Reciprocal 4-tuple.

Case4: Construction of Pythagorean triple and Reciprocal Pythagorean for 5-tuple

Lemma 4.1: If \((a, b, c, d, e)\) is a Pythagorean 5-tuple \((a^2 + b^2 + c^2 + d^2 = e^2)\) then \((bcde, acde, abde, abce, abcd)\) is becomes to corresponding Reciprocal Pythagorean 5-tuple.

Proof: Consider \(\frac{1}{(bcde)^2} + \frac{1}{(acde)^2} + \frac{1}{(abde)^2} + \frac{1}{(abce)^2} + \frac{1}{(abcd)^2} = \frac{a^2+b^2+c^2+d^2}{a^2b^2c^2d^2e^2} = \frac{1}{(abcd)^2}\).

Hence \((bcde, acde, abde, abce, abcd)\) is a Reciprocal Pythagorean 5-tuple. Continuing Lemma 3 to above 5-tuple, we obtain successively Pythagorean and Reciprocal Pythagorean 5-tuples respectively.

Main Work:
In the proposed system, three parties are involved in the key exchange process. i.e Key distribution center (KDC), source (A) and destination (B). If A wants to communicate with B using symmetric key encryption, a session must be created between them. A secret session key shared between and B is required for the encryption of data in this session.

Application of Pythagorean Triple in Cryptosystem
Key generation and Secure are critical to the security of a Cryptosystem. If fact key generation and key exchange is the most challenging part of cryptography. In this chapter, a scheme for symmetric key generation based on the Pythagorean triple has been presented. The proposed scheme incorporates a Key Distribution Centre (KDC) for user authentication and secure exchange of secret information to generate keys. The KDC operation involves a request from a user for initiation. The KDC authenticates authenticate and secures the exchange of secret information to generate keys. The KDC authenticates the initiator. If the authentication is successful, KDC generates and sends an encrypted timestamp to both the initiator and responder.

The proposed system is based on a novel mechanism to determine Pythagorean triples to generate keys. The formula uses factors of x to generate y and z such that x, y, and z satisfy the Pythagorean theorem.

The following notation has been used for Pythagorean triple calculation:

\[ x \rightarrow \text{input to calculate Pythagorean triple} \]

\[ p_1 \rightarrow \text{First prime factor of } x, \quad p_2 \rightarrow \text{Second Prime factor of } x \]

\[ y \text{ and } z \rightarrow \text{Key Pair, Suppose, If } x \text{ is odd then } y = \frac{|x^2-p_1^2|}{2p_1} \text{ and } z = \frac{|x^2+p_1^2|}{2p_1} \text{ the final key is computed by XORing } y \text{ and } z. \quad \text{i.e. } p = y \oplus z \]

In the proposed system, three parties are involved in the key exchange process. i.e Key distribution center (KDC), source (A) and destination (B). If A wants to communicate with B using symmetric key encryption, a session must be created between them. A secret session key shared between and B is required for the encryption of data in this session.

Construction of Pythagorean triple for n-tuple:
The Pythagorean n-tuple, \( x_1^2 + x_2^2 + x_3^2 + x_4^2 + \ldots + x_{n-1}^2 = x_n^2 \) has been used to construct a tree. A binary tree of height n has been generated whose leaf nodes are \( x_i \)'s, for \( 1 \leq i \leq n - 1 \) and the root is \( x_n \). As illustrated in the given Figure, the leaf nodes are [1]
$x_1, x_2, x_3, \ldots, x_i, \ldots, x_{n-1}$ and the root is $x_n$ which constitutes the Pythagorean n-tuples
$[x_1, x_2, x_3, \ldots, x_i, \ldots, x_{n-1}, x_n]$ and satisfies the equation $x_1^2 + x_2^2 + x_3^2 + x_4^2 + \ldots + x_{n-1}^2 = x_n^2$.

The Procedure is defined as follows:

Step 1: choose $x_1$, where $x_1 > 3$;

Step 2: let $t$ be a temporary variable initialized as follows;

$$t = x_1$$

Construct a binary tree (T) by taking $t$ as the root, $x_1$ as the left child and $x_2$ as the right child which is calculated by applying step 3.

Step 3: for $1 \leq i \leq n - 1$, apply the generation of key elements from the above methods.

For suppose, $x_{i+1} = a(t)^2 - \frac{1}{4a}$

$$p_i = a(t)^2 + \frac{1}{4a} ,\text{where } a = \begin{cases} \frac{1}{2p}, & p \text{ is a factor of } x_1^2, \text{if } x_1 \text{ is odd} \\ \frac{1}{4p}, & p \text{ is a factor of } \left(\frac{x_1}{2}\right)^2, \text{if } x_1 \text{ is even} \end{cases}$$

$$t = p_i$$

apply the above algorithm to construct the Pythagorean tree.

Some integer sequences are satisfied with the properties given below.

$$3^2 + 4^2 = 5^2$$
\[ 3^2 + 4^2 + 12^2 = 13^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 = 85^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 204^2 = 221^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 720^2 = 725^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 204^2 + 60^2 = 229^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 204^2 + 1428^2 = 1445^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 720^2 + 1740^2 = 1885^2, \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 204^2 + 1872^2 = 1885^2 \]
\[ 3^2 + 4^2 + 12^2 + 84^2 + 720^2 + 2040^2 = 2165^2 \]

**Conclusion:**

The proposed system is based on a novel mechanism to determine Pythagorean triples to generate keys. The formula uses factors of \( x \) to generate \( y \) and \( z \) such that \( x, y, \) and \( z \) satisfy the Pythagorean theorem.

The following notation has been used for Pythagorean triple calculation:

- \( x \) - input to calculate Pythagorean triple
- \( p_1 \) - First prime factor of \( x \)
- \( p_2 \) - Second Prime factor of \( x \)

\( y \) and \( z \) – Key Pair

Suppose, If \( x \) is odd then \( y = \frac{|x^2 - p_1^2|}{2p_1} \) and \( z = \frac{|x^2 + p_1^2|}{2p_1} \) the final key is computed by XORing \( y \) and \( z \).

i.e. \( p = y \oplus z \)

In the proposed system, three parties are involved in the key exchange process. i.e.

Key distribution center (KDC), source (A) and destination (B). If A wants to communicate with B using symmetric key encryption, a session must be created between them. A secret session key shared between and B is required for the encryption of data in this session.
