Clear cell adenocarcinoma of the ovary

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Clear cell adenocarcinoma of the ovary. ORPHA:398971*

Clear cell adenocarcinoma of ovary is a rare, malignant, epithelial ovarian neoplasm, composed of clear, eosinophilic and hobnail cells displaying variable degrees of tubulocystic, papillary and solid histological patterns, macroscopically appearing as a typically unilateral mass in the ovary which ranges from solid to cystic. Patients are often diagnosed in early stages and usually present with pelvic pain and pressure, an abdominal mass and/or gastrointestinal problems, such as early satiety or bloating. Association with Lynch syndrome has been reported.
