1. It is good to know about the rare side effect of the drug.
2. Can you provide a specific percentage range for the prevalence of MILA in rheumatoid arthritis patients?
3. Can you suggest any specific studies or data sources that provide the prevalence range of MILA in rheumatoid arthritis patients?
4. What specific timeframe should clinicians monitor for lymphadenitis onset after starting methotrexate treatment?
5. Was the neck swelling unilateral? What about other lymph node enlargements (axillary & inguinal)?
6. Could you elaborate on why FNAC was chosen over excision biopsy in this case, and what implications this might have for the diagnosis?
7. What was the differential diagnosis for the neck swelling?
8. What was the category of the WHO-UMC criteria?
9. Can you provide any recommendations for specific follow-up protocols to monitor for MILA in patients on methotrexate?
10. Can you specify what additional investigations or tests could help in establishing a definitive link between methotrexate and lymphadenitis?
