Potential competing interests: No potential competing interests to declare.

This manuscript investigated soil stabilization in soft soils through the addition of sand to soil-cement piles. In general, the manuscript is interesting and definitely of value to the readership. There are some questions to be answered and clarified before publication. Some specific comments are given below:

1. The authors should describe more findings of previous works and illustrate the difference between the previous works and yours.
2. In the last paragraph of the Introduction Section, the authors should present a clearer research gap and novelty of this work.
3. The reviewer suggests converting some texts into tables or figures to make it more readable.
5. The Conclusion section is very generic. Please address the major contribution of this work.
6. In some places, the text is unclear, and the English language used is not of high quality. A rigorous round of proofreading is highly recommended.
