This is an interesting work; however, it resembles more of a technical report than a scientific journal article. The title does not accurately correspond to the content of the paper, particularly concerning sustainability.

The methodology section needs to be more detailed and clear, especially in terms of the types of treatments and the statistical analyses performed. Additionally, it is recommended to translate the figures into English for better comprehension.

Some of the results presented do not seem to align with the methodology and objectives, requiring a more thorough analysis and a more robust discussion of the results. In the conclusion section, a more concise approach is suggested, focusing on summarizing the main objectives of the work.
