Comments

The study evaluated "The Application of PROMETHEE with the recalculated weight method as a more accurate measurement for the selection of the best Hybrid Renewable Energy Technology for a slum building". Hence, the overall presentation is fair enough but the paper needs major improvement for it to be considered for publication.

1. Author is suggested to revise the title of the paper.
2. For "abstract section", it should reveal the aim of this study, methodology, result & discussion and conclusion.
3. For "Methodology section", it should well-arranged and if possible, some of the equation should be merged. The line and paragraph spacing is too much.
4. For "Results section", Author is suggested to merge some of the results; the presentation of this result is making the paper boring and not presentable.
5. For "Discussion section", the explanation are too shallow, unconvincing and not scientific. Authors did not compare their findings with other numerous studies carried out in this area of research. The implications of the findings from this study should also be stated. Authors need to thoroughly discuss their own results and provide scientific and justifiable reasons for their study.
6. For "Conclusion section", there should be a sub-section for conclusion, instead of joining the section with discussion section and again other than repeating key results, Authors should discuss the significance of their findings. What are the limitations and future scope of this study? This part needs to be improved for clarity purposes.
