Potential competing interests: No potential competing interests to declare.

The study introduces a novel perspective on the co-evolution of intelligence and longevity, proposing a genetic basis for their association. This hypothesis adds depth to our understanding of human evolution and the interconnectedness of biological traits. By integrating concepts from evolutionary biology, genetics, and neuroscience, the author offers a comprehensive analysis of the potential mechanisms underlying the relationship between intelligence and longevity. This interdisciplinary approach strengthens the theoretical framework of the research. This very interesting article can be published.
