Potential competing interests: No potential competing interests to declare.

The present paper examines developments in income inequality in Greece since 2017, primarily focusing on the impact of the pandemic crisis and the regional dimension of inequality. The data used in this analysis come from the Greek dataset of the EU-SILC for the period 2018–2023. The article is clear and concise, making it easy to follow, with good explanations provided for each indicator. While it offers valuable insights into the dynamics of regional inequality, a more extensive literature review would help contextualize its research questions and findings. A deeper exploration of the socio-economic factors contributing to rising inequality in disposable income would be beneficial. Additionally, expanding the conclusion to summarize key findings and propose policy recommendations, possibly alongside a comparative analysis with other countries, could enhance the paper's depth and impact. Best wishes for the further improvement of the article and publication!
