Congratulations on the work. The article has great potential but needs some adjustments for publication. It would be interesting to detail the methodology of how the review research was designed. Some paragraphs do not have references, especially item 3, "Pickle Production," and there is a need to review the presentation of references in the text. Perform a correction of scientific names. In the paragraph "Pickled fruits typically have a normal size to width ratio of around 3, appearing mostly long and three-sided," the unit of measurement for the size of the cucumber was not included.
