Potential competing interests: No potential competing interests to declare.

Areas for Improvement:

The article could benefit from improved clarity in certain sections. For instance, the phrase "all of the cases had lesions on their bodies" is redundant, as Buruli ulcer primarily affects the skin.

While the article includes references, there are instances where specific claims or statistics could benefit from in-text citations to support the information presented.

The discussion section could be more extensive. It would be beneficial to explore the implications of the study's findings in more depth and relate them to the broader context of Buruli ulcer research and control efforts.

While tables are useful, the inclusion of graphical elements such as charts or graphs might enhance the presentation of certain data, making it more accessible to readers.
