Potential competing interests: No potential competing interests to declare.

- Can you specify what aspects of the diagnosis and treatment were particularly well-explained and why? The lymph biopsy was the clearest diagnostic, and the regression of lymphadenopathy after stopping methotrexate was the most emphatic part of the article. In fact, it is a known issue, but sometimes it can be overlooked. A very good diagnosis was made, and treatment was arranged. Well explained and fluently expressed. I accept the article.
