As it is known, I have previously reviewed this manuscript (MS) and sent the reviewer report. The MS required significant correction and major revision. According to my report, some minor corrections were made, but no additional corrections and/or necessary clarifications were made regarding the previous report. For example, if 1.60 Kc was found, at least the details of this can be stated in the text where the error originates. Although the experiment included irrigated legumes, all the details regarding the irrigation method and other details regarding the irrigation, which I saw as significant deficiencies under the heading of "Monitoring Soil Moisture Depletion" mentioned in the previous report, were missing, and this is still not given. Reference ET in the text was given as ETp. However, it should be used as ETo. For example, 25 mm/m, what does m mean here? As a result, the authors have not yet made critically important revisions.
