

Review of: "An automatic screening method for strabismus detection based on image processing"

WEICHUNG SHIA

Potential competing interests: The author(s) declared that no potential competing interests exist.

Pros:

The research method uses image analysis methods and analyzes the possibility of strabismus based on eye images, which is helpful for initial diagnosis in areas lacking expensive ophthalmic equipment.

Cons:

1. Fewer samples (30 cases, 30 control). Larger standard deviation in Table 1 indicates that need more samples to include more possibilities in real world.
2. The similarity value is used as the final criterion for judging whether strabismus.,It is a lack of comparison of true diagnostic efficacy (AUC or PPV / NPV).
