

# Review of: "Determinants of Corporate Financial Performance in African Insurance Market"

Fredrick Otieno Okuta<sup>1</sup>

<sup>1</sup> Jomo Kenyatta University of Agriculture and Technology

**Potential competing interests:** No potential competing interests to declare.

1. Measurement of variables section is well-done.
2. Confirm if all the independent variables included in the conceptual framework have relationships with the dependent variables from past studies. Also, the independent variables are too many and therefore your regression result might be spurious. Can some of the independent variables be proxied or are proxies of other variables such as GDP?
3. The theoretical framework is lacking in the study.
4. Research methodology section is still in future tense and therefore is confusing to the reader.
5. Why did the author choose non-probability sampling design for a scientific study? There should be a rationale for such decision.
6. The longitudinal data ranges from 2010 to 2022, is there a rationale for this? why not data ranging say from 2000 to 2022?
7. Data analysis method utilized multiple regression techniques that do not take into consideration the lagged effects of the independent variables on the dependent variable, why not econometric models such as ARDL and VAR?
8. Are the correlation results in line with your theoretical thinking in the study?
