Dear authors,

The submitted article on apple juice needs improvement to be considered as a scientific article.

The language used needs to be corrected; it is currently more suitable for a popular science article than a scientific one.

If it is intended for a wide audience (not exactly being scientific), it is acceptable. If, on the other hand, it is designed to serve as an introduction to further analysis for scientists, then I would ask for corrections.

1) I understand the steps, but in the second part, it could be confusing as you have started with a description of juice, then in chapters "Regulates Blood Sugar; Aid Cancer Prevention; Reduce Asthma Symptoms; Eye Health," as well as Table 1, you have described apples, not juice, properties and effects. Please change this section. Please also add information on juices to Table 1.

2) General comment - it would be worthwhile to link the chapter on juice production to the changes that take place in apples or juice during the various processes.

3) Why is juice preservation described in a separate section? Do not other processes affect its quality?

4) I would ask that section 6 be expanded; it would be worth mentioning some of these technologies in more detail.

I hope the information here will help you improve your work.
