Potential competing interests: No potential competing interests to declare.

As the world is in the midst of a global energy and environmental crisis, promoting sustainable development and combating climate change has become the most urgent and vital issue. Sweden is a global leader in decarbonisation introducing the carbon pricing and driving clean energy transition. India is a rapidly growing economy and is improving electricity security as it seeks to integrate higher shares of variable renewable energy into its energy mix. The results of a paper comparing these two countries could be very useful to policy makers and urban planners. However, the paper does not meet the minimum requirements of a scientific article. First, introduction must be stronger with current reference and highlight that this work is useful in the field. Second, the cases of the selected countries must be given in more details with related references. I also suggest that the paper must present a discussion part comparing the cases regarding all the key points handled. Finally, conclusion must provide a more practical and effective approach to accelerate sustainable development in India.
