**Potential competing interests:** No potential competing interests to declare.

The topic addressed in the article is an interesting one, which is why there is a lot of literature in the field of mathematics education research that deals with it.

As for the format of the article, the writing could be improved, and the inconsistent use of citation style could be improved. In terms of content, it is noted that in the section on "Math Anxiety Diagnosis," there is a worrying absence of references to support the statements made, even more so considering that, as stated in the conclusions, "Our goal in this study was to give a comprehensive overview of the literature on math anxiety," therefore, it is assumed that this is an eminently theoretical study, which is why support in the scientific literature published to date should be fundamental for this article. On the other hand, where are the suggested strategies obtained from? From a review of the literature? From a study conducted? This question is not made clear in the article.

Finally, the concluding section is very brief and generic, giving the impression that it could have been written without having read much on the subject.

As I mentioned at the beginning, it is a very interesting topic, and the author could address it in greater depth by following the suggestions for improvement received through this review process.
