My dear

Your article

"QMH (Quantifying Mental Health) Key Technologies"

discussed the requirements and key technologies based on Ontological Engineering. It lies at Artificial intelligent domain. It dependent on developing world knowledge database, which is necessary for understanding of mental health. Your system's (requirements, architecture, analysis, conclusion) are stated in a clarity manner. I hope you present the best at developing your system for forensic simulation of the mental health.

you can correct the word "technologies" at second line of your abstract.

I do not understand the reason to talk about work of another team at your abstract.

you can refer to fig.6 at the last paragraph in page 8.

at your conclusion section; I hope to find referring to your fig.s 10, 11, 12, and 13.

I am asking about the figure at page 16, no label and no referring to it.
