Potential competing interests: No potential competing interests to declare.

The paper appears to be a review of drone-based imaging work and lacks novelty; the authors need to add inputs in the introduction section of the paper. The proposed mechanism also does not appear to be well written, and the results presented are not sufficient to justify the claims. The workings of the fuzzy algorithms presented in the paper are not very clear and need to be strengthened further.

There are spelling and grammatical errors observed in the paper.

The application of the ANFIS model in drone image processing, as specified by the author, is to be given more importance.
