The article 'Determining When Schrödinger's Cats Die' is very intriguing and is related to the metrological approach of describing the result of an experiment.

The metrological definitions used are 'precision', 'accuracy' and 'calibration'.

To familiarise readers with these terms in detail, I propose that a reference to the current VIM metrology dictionary on the Bureau International des Poids et Mesures website should be included in the bibliography:

<https://jcgmbipm.org/vim/en/index.html>

so that readers who are not specialists in this field can develop their competence in this area.
