Non-hypoproteinemic hypertrophic gastropathy

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Non-hypoproteinemic hypertrophic gastropathy. ORPHA:329883*

Non-hypoproteinemic hypertrophic gastropathy is a rare gastroesophageal disease characterized by diffusely enlarged gastric folds, excessive mucus secretion, normal serum protein and gastric TGF- α levels. Patients typically present anemia, abdominal pain not related to eating or bowel habits and absence of peripheral edema.
