

Review of: "Neutronic Chain Reactions for Polonium-210 Production"

George Morton

Potential competing interests: No potential competing interests to declare.

The paper is concise and the results are presented clearly. The author discusses the potential applications of this new method for Po-210 production, including the ability to produce large quantities of Po-210 more quickly and cost-effectively than the current method.

Minor comments:

- The author should provide more information about the neutron source used in the experiment.
- The author should discuss the safety implications of this new method for Po-210 production.
- The author should discuss the scalability of this method.
