Potential competing interests: No potential competing interests to declare.

First of all, thank you for your study and your publication. It is very pleasant to read.

It is indeed an exploratory study on a small group.

You highlight the limitations of the participants' self-reports.

It would be interesting to know the origin of your questioning: which observations and which questions are at the origin of this research?

Thank you to have specify what hypermobility is and the notion of neurodivergence.

A nuance in relation to your work about fibromyalgia. Whatever the dimension explored, most of correlations are positive: with hyperactivity, with intellectual precocity, with hypersensitivity, with sexual abuse in childhood, etc. A pathology in search of explanation we might say ?
