Review of: "Monitoring of Cell-free Human Papillomavirus DNA in Metastatic or Recurrent Cervical Cancer: Clinical Significance and Treatment Implications"

Priya Ranjan Debata¹

1. Maharaja Sriram Chandra Bhanja Deo University, Baripāda, India

1. The work is conducted well. However, the authors have found 100% efficiency in detecting HPV DNA in serum using DDPCR. A negative control, such as the serum from the patients excluded from the study, could have been used as a negative control. This is required for accepting the manuscript.
2. The authors highlight why the circulating HPV DNA is more in metastatic patients in the discussion.
