

# Review of: "Health Outcome and Economic Growth: The Case of Malaria in Nigeria"

Napa Komal Kumar

**Potential competing interests:** No potential competing interests to declare.

This investigation explored the complex relationship between economic growth and health outcomes, placing particular emphasis on the influence of malaria in Nigeria.

In Nigeria, private spending on healthcare exceeds the funds allocated by the public sector. The majority of private current expenditures are direct out-of-pocket payments, with minimal contributions from private insurance schemes such as the National Health Insurance Scheme.

Addressing Nigeria's unique health challenges requires the establishment of a public health infrastructure, though the private sector can play crucial roles. Collaboration between the private and public sectors for healthcare provision is a globally recognized and welcomed practice, allowing for a more comprehensive approach to addressing health needs.

This work can be recommended for publication as it has some insights.
