This study proposed the Hypothesis(1) that POB is associated with WPC. This means there was a related relationship between POB and WPC, which should be presented with a bidirectional arrow in Figure 1. The same principle can be presented in Hypothesis 2.

The literature showed that biodiversity loss is considered to impact CTN negatively (Kaltenborn et al., 2016). This might imply some relationship between POB and CTN. However, this study needs more solid references to confirm the relationships for each hypothesis, especially the roles of mediators. Hypothesis 3 and Hypothesis 4 presented some contradictory statements.
