Hello, I have the following comments:

1. The topic is interesting, but the author should make the contribution clear. In this paper, the quantile regressions of four countries are compared, but what the results can be used for is not clear to me.
2. The author should include other works applying quantile regression on COVID-19 in introduction.
3. The author can provide the rationale of the variable selection, which can be linked to the goal of the research.
