# Cediranib Maleate

National Cancer Institute

## Source

National Cancer Institute. *Cediranib Maleate*. NCI Thesaurus. Code C48379.

The maleate salt of an indole ether quinazoline derivative with antineoplastic activities. Competing with adenosine triphosphate, cediranib binds to and inhibits all three vascular endothelial growth factor receptor (VEGFR-1,-2,-3) tyrosine kinases, thereby blocking VEGF-signaling, angiogenesis, and tumor cell growth.
