

Peer Review

Review of: "Human Recognition-Behavioural Adaptation System Analyzed via Structuralism and Systems Theory"

Parul Saxena¹

1. Sharda University, Noida, India

Though the author has done a commendable job with the research, the purpose and the outcome have not come out strikingly. The research lacks direction, and the purpose requires a lot of structuring in terms of language and grammar. As a reader, I am not able to comprehend the research well and am also not able to gauge the novelty of the research. The research methodology is also missing – as to what methods have been employed to conduct the research. My suggestion to the author would be to convert this article into a review article and propose a framework to study the Human recognition and behavioral adaptation system. Attached is the annotated file for reference. The following sections need more clarity:

- **Abstract** : lacks purpose and the outcome
- **Introduction**: Lacks citations and definitions
- **Research Methodology**: Is completely missing

Language and Grammar: The tense is scattered all over the document. It is suggested to get the entire document copy-edited. Please refer to the annotated file where a few sentences have been highlighted to be rephrased for more clarity and conciseness.
