I would like to express my profound appreciation for the invitation given to me to review the article included on the Qeios platform. Participating in the academic community through the provision of critical feedback on scholarly works is consistently regarded as a prestigious endeavor. After doing a thorough examination of the article, I have found that:

1. The title goes like "Optimizing Wastewater Treatment Performance System and Achieving Greater Efficiency to Improve Water Quality for Sustainability — A Review". Sustainability on this not discussed.
2. It has various Grammatical errors.
3. Figures are not clearly stated.
4. Methods of literature review are not mentioned.
5. The abstract discusses very little about the literature review and results.
6. There should be a separate section for its relationship with sustainability.
7. The state-wise data mentioned in the introduction is nowhere mentioned in the results.

Right now, the manuscript is not suitable for publication because it contains very little content that has not been covered elsewhere. The authors should be urged to revise the manuscript considering the suggestions that have been made and then resubmit it so that it can be considered for publication.
