Potential competing interests: No potential competing interests to declare.

The manuscript addresses the relevant and recent issues.

The topic is giving an update of potential of coastal dynamic and its natural protection, integrating the hydrology, geomorphology with the vegetation features.

The statistic and modelling approach well described to explain and evaluate each factor of the study parameters.

The suggestions came up since the vegetation cover were observed. It may need the graph or table, or even the vegetation distribution illustration to clarify the density and types of vegetation at the shoreline. Since the type of vegetation may stands along the coastline or stands to the inland.
