It is an interesting review paper with the title of "The imperative of a comprehensive one health approach for mosquito-borne disease control in Indonesia" addressing vector-borne disease control, and it pointed out the importance of the application of a one health approach. The author also mentioned the potential strategy of a one health approach for future disease control programs. This paper presented understanding of the one health approach and its linkage between human, animal, and environmental health issues. It is suggested to address more on cross-sector collaboration and policy implementation, topics which are main tools for successful implementation. The concept of the use of a one health paradigm is theoretically acceptable, but practically, it needs to address the potential constraints of that approach which could introduce barriers or limitations facing many countries. It is suggested to use a one health approach with harmonization, optimization, and empowerment of three parties to achieve the target of effective mosquito-borne disease control in Indonesia. Anyway, it is a very impressive paper providing information on the one health approach and vector-borne disease control in Indonesia.
