

# Review of: "Carcinogenesis and Angiogenesis Study Induced by Anthrachinone Plants and Hydroxyanthracen Derivatives in Chicken Eggs"

Oguz Karahan

Potential competing interests: No potential competing interests to declare.

The study was certainly well designed and presented on a scientific basis. The method is innovative. However, some points should not be overlooked: Some pictures are blurred, as in the plant showing the inflammation. Clearer images should be preferred. Angiogenesis images may also be useful. The study contains too many grammatical errors. Another issue is related to discussion. The most recent reference is from 2013. By adding more recent studies, the results and method can be confirmed more qualified.
