**Potential competing interests:** No potential competing interests to declare.

The article is interesting and points out to a wide area of discussion. It's a very important issue nowadays and must be addressed with great attention. But for someone who is not familiar with the key topic will be a little lost. The abstract needs to be modified with a more suitable language. Sentences like "Its complex-adaptive dynamics couple human practices and the geosphere (e.g., through buildings, mines, shipping), causing massive fluxes (e.g., of energy, water, materials), implies extensive civil-engineering works (e.g., housing, transport, infrastructure)." must be rephrased to be more meaningful to a wider audience. Also, there is no definition of geoscience literacy or a figure relative to the key topic. It is very important for generic audience quick understanding. Likewise, I think article lacks of geoscience's literacy enhancement.
