

# Review of: "[Commentary] The Polyfollicular Anovulatory Androgenic Syndrome: A New Label for an Old Syndrome"

Hurjahan Banu

**Potential competing interests:** No potential competing interests to declare.

There has been a debate for a long time over the name "Polycystic ovary syndrome" as it is a misnomer and there is no cyst inside the ovaries. The author discussed this fact appropriately and reasonably. The name he proposed has some important terms like "anovulatory" and "androgenic". But all PCOS patients will not have anovulation. There is also some PCOS patients who do not have any androgenic features. Instead of Polyfollicular Anovulatory Androgenic Syndrome which is a much longer name, we can call this Polyfollicular Ovarian Syndrome or PFOS.
