Virus-associated trichodysplasia spinulosa

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Virus-associated trichodysplasia spinulosa. ORPHA:228379*

Virus-associated trichodysplasia spinulosa is a rare infectious skin disease characterized by the development of follicular papules with keratin spicules in various parts of the body, predominantly in the face (e.g. nose, eyebrows, auricles), that is due to polyomavirus infection in immunocompromized patients.
