Thanks for such an opportunity. The article is well organized and informative, however, there are some notes I hope to be helpful.

1. The material and method are short and need more details including the exact study period, sampling size, statistical test used, P value and response rate.
2. Result: Each tables and diagrams should be followed by an explanation of findings and including the result of statistical analysis, test of significance and P value
3. I didn't see in the table or diagram a comparison between preclinical and clinical stages. Although you mentioned the comparison in the discussion.
4. What is the reinfection rate in the study sample? You mentioned studies in other countries, but you didn't compare them with the results of your study.
5. Need to discuss the result of common presenting symptoms? There are 2 tables in result exploring the common symptoms of COVID-19 and these diagrams were never discussed in the discussion section.

In short, I am satisfied with the present study with minor modifications needed.
