The study Knowledge of Risk Associated with Exposure to Per- and Polyfluoroalkyl Substances in Abuja, Nigeria explores an interesting topic, investigating the perception of Nigerian people about PFAS risks. However, the paper presents major limitations, being based on the results of a very basic questionnaire that could be improved in order to better define and contextualize the issue. For example, it would be interesting to integrate more information about possible exposure pathways and PFAS sources and to understand what kind of background information has been provided to people.
