The paper, titled "Effect of Bromide on Livestock Development," aims to summarize the impact of bromide on livestock production. In my opinion, the paper is not yet ready for publication. The topic is interesting, but the authors need to better contextualize it in the introduction section. Specifically, why is this element important?

Below are some comments for the authors:

General Comments:

- I recommend the authors rewrite the abstract. An abstract should provide an overview of the content of the paper. Therefore, I suggest lengthening it and simultaneously improving its readability.
- The materials and methods section should be expanded. The authors should include the keywords used for the literature search and the number of articles found. It would also be appropriate to include the criteria for paper inclusion.
