**Potential competing interests:** No potential competing interests to declare.

This article is on sectoral GDP and tax revenue in 34 provinces of Indonesia. The article lacks fundamentals of a conventional research paper. For instance, there is no section for literature review (theoretical and empirical literature), no method, and no data. The author should also present the result of the correlation matrix so that we can see the index of similarity and how he/she dealt with it. In addition, I feel the introduction is weak because the author did not tell us the sectorial contribution of each sector to the total GDP of Indonesia and revenue-derivable from each of them. The author can include these stylized facts in the introduction to enrich it.
