Review of: "Evaluation of Antidiabetic Potential of Gymnema Sylvestre and Metformin Combination in Streptozotocin-Induced Diabetic Rats"

Ami Febriza¹

1. Physiology, Universitas Muhammadiyah Makassar, Indonesia

The introduction offers background but lacks a clear research problem statement. The problem needs more emphasis to guide the reader to the study's objectives. Transitions from background to objectives feel abrupt in places. The methodology section is mostly clear, yet it falls short in providing a thorough explanation of the experimental design and the rationale behind the chosen methods (e.g., the reasons for selecting a particular statistical test). This requires further clarification to ensure reproducibility. The discussion contains some repetition, with numerous restatements of the results lacking deeper analytical or critical insights. Increasing engagement with existing literature would help contextualize the results within the broader scientific landscape.
