Waste plastic material handling is a live problem. Authors have chosen the best way to utilize plastics for pavement fabrication. I suggest the following points to improve the quality of the manuscript:

1. Abstract is too long. It should be short and precise.
2. Add more recent studies related to the particular problem.
3. Sand properties must be elaborated and should be discussed in the manuscript.
4. Elaborate the specimen fabrication process.
5. Basis of composition should be discussed.
6. Name the samples prepared with specific compositions.
7. Mechanical testing results should be elaborated with valid justification.
8. Microstructural analysis should be included for more clarity of pavement mechanical behavior.
