Thank you for inviting me to review this article, I would like to point out that the number of patients across the article are not consistent is it 23 or 26 ? Additional point is that they state initially that were 2 groups one group underwent phacoemulsification and the second group underwent phacoemulsification and i stent surgery then in discussion of surgery they state that all patients underwent phacoemulsification and i stent surgery ? They should clearly define the groups and the number of patients and number of eyes in each group and compare the results between them.
