Potential competing interests: No potential competing interests to declare.

The paper proposes a method to use the bootstrap method for selecting variables in the generalized extreme value regression. It's an intersting work. I think there are some areas that the paper needs to be improved.

1. The paper talks about generalized exteme value regreesion, but it doesn't talk about why the data used belong to this scenario.
2. The results is not mentioned in the abstract part.
3. There can be more discussions on the future work.
4. Many missplellings or typos like “fi t”, “infl uence”, “forexample”.
