Dear Authors,

The paper is well written and covers the declared aim to highlight the management of anesthesia in orthognathic surgery.

I congratulate you on your work.

If your aim is to provide some adjunctive skills, please check if there is something new on submandibular intubation.

Surgical procedures, and their anatomical peculiarities, should be better described to better understand the need for nasal intubation. Although we consider it a must, in many hospitals, nasal intubation is still considered as a not always necessary procedure when performing oral surgery. Please define the need for this kind of technique.

Have you explored the field of contemporary nasal surgery and/or ancillary surgical procedures?

If yes, please highlight.

If no, please introduce the problem and discuss why you have not considered it in this paper.

The bibliography is essential; be more exhaustive.
