Potential competing interests: No potential competing interests to declare.

The paper seems to be an interesting article for areas lacking applications such as a web database system for monitoring crimes. The interfaces are authentic and well-designed. However, the authors should take note and make available what particular computational model (Auto-correlation is used to keep the database up to date and well-driven. Is it adaptive? If so, across what platform?). The authors should also specify the area of most contributions to the fields of research (software engineering and database management systems), as there are lots of crime database management systems out there (health care management systems, school administrative management systems, e.t.c.). What is their most significant contribution? This should be specified, and areas of future development should be indicated.
