Potential competing interests: No potential competing interests to declare.

The authors aim to develop a food data automation platform. To achieve their goal, they have used a PaaS cloud computing platform. Though the abstract is well-written, there is a lack of motivation behind the work. If added, it will strengthen the abstract. The initial parts of the introduction lay a foundation for the basic terminologies and concepts related to the work presented in the paper. However, in the 3rd paragraph of this section, the authors suddenly switch from English. A similar observation is made for Table 2. Before submitting, the paper should be properly read to avoid such errors. The gaps observed and the objectives to achieve them should form a part of the introduction. There is no literature review or information on related works. The paper jumps to the method section, which mentions the background that is supposed to be a part of the introduction. It should highlight the methodology adopted to develop the automation platform. However, no details, block diagrams, or flowcharts are available in the method section, and the paper directly jumps to the results. Section 3.1 mentions the data utilized in the work. The authors should provide more insight into this. Figure 1 is a generic representation; thus, it should form a part of the introduction. The same goes for Figure 2. It is difficult to track whether it presents generic information or is specific to the presented work. More information is required in this section, and some parts of the paper need modification.
