Potential competing interests: No potential competing interests to declare.

The paper is written straightforwardly and clearly. However, I would appreciate the author adding more information or corrections.

- 1) Add more information to the Figure 1 legend especially labeling the molecules.
- 2) It's tricky to determine the leveling off in DAB oxidation in Figure 2; having one more reading at a higher concentration would be preferable to show the levelled point.
- 3) All graphs are missing error bars and information on the number of replicates.
- 4) Thorough reading for correcting mistakes like Nanozymes or nanozymes
