Potential competing interests: No potential competing interests to declare.

Explaining incorrect claims about the inconsistency of relativity may have didactic value, so it may be useful for students. However, the present paper is too short to be useful. The author should develop and explain Dingle's argument in detail. In its present form it is unintelligible unless the reader is already familiar with it.

Nowadays no serious scientist doubts SRT's consistency. However, inconsistency claims exists among nonscientists and aficionados usually dubbed crackpots. It is of no use trying to explain them anything but refuting their claims maybe an interesting exercise for students.
