Review of: "The association of smoking status with SARS-CoV-2 infection, hospitalisation and mortality from COVID-19: A living rapid evidence review with Bayesian meta-analyses (version 11)"

Luis del Carpio-Orantes

Potential competing interests: The author(s) declared that no potential competing interests exist.

After reviewing the document, I consider it provides important evidence that smoking, through nicotine, has a protective effect in cases of COVID-19, a situation that has already been discussed in previous documents and that had been glimpsed in the first series of Wuhan patients until a Mexican review of the affected population, but after this analysis, it takes a greater boom and hilarity of ideas, so I consider it prudent to communicate these results of this meta-analysis with a good statistical and review basis
